

STS1-E300 REPLACEMENT FEEDBACK ELECTRONICS

The STS1-E300 (“E300”) has been successfully deployed in the global networks, and serves a critical operational function in the networks’ on-going operations. We consider the support of this product to be a high priority. Discontinuance of the M2166/VBB will allow limited resources to be allocated to support of the E300. Metrozet will focus on responsive support of the E300, not new sales. Effective immediately, new orders for the E300 will no longer be accepted.

The E300 will be responsively supported until March 1, 2019. Further support beyond that date may be evaluated at that time. It is expected that as new sensors are incorporated in on-going GSN operations in the next 3 years, sufficient existing viable E300 inventory will be made available from discontinued STS-1 operations to sustain remaining installations for a significant period until GSN sensors can be replaced. Sufficient operational E300 units should remain to support a skeletal STS-1 network in a small number of the most high-quality deep underground sites for at least a decade.
